ENGINEER
a world of
DIFFERENCE

WALTER SCOTT, JR.
COLLEGE OF ENGINEERING
COLORADO STATE UNIVERSITY

Electrical and Computer Engineering Senior Design Lab

ABOUT THE SPACE:

The ECE Senior design space is a hub for electrical and computer engineering (ECE) students in their final year. Here, teams take a project from an idea to a working device, putting everything they have learned in the classroom into practice.

This lab is also where students learn what it means to be a practicing engineer. Through the Engineer in Residence program, the department brings engineering professionals to campus to mentor teams, share their perspectives, and help students navigate life after college.

The RamBOTs team builds and maintains a four-legged robot ram that can walk, dance, and do push-ups, and brings it to outreach events to introduce the community to robotics. This year they are keeping the current robot, Sparky, running while designing its next-generation replacement.

Another team is building the Multiview Snowflake Profiler, a system that photographs falling snowflakes from multiple angles and measures their fall speed, size, and shape to improve weather prediction. It has to run on its own through Colorado winter storms, in temperatures as low as -40°F. Both teams bring together electrical, computer, and mechanical engineering students.
