ENGINEER
a world of
DIFFERENCE

WALTER SCOTT, JR.
COLLEGE OF ENGINEERING
COLORADO STATE UNIVERSITY

Biomedical Engineering Teaching Lab

ABOUT THE SPACE:

The primary focus of biomedical engineering (BME) is to improve human health and well-being by integrating engineering concepts with medical and biological sciences. At CSU, this is done by pairing BME with one of four partner majors: computer engineering, electrical engineering, mechanical engineering, or chemical and biological engineering.

Taken in the third year of BME, this course is one of the first times BME students work with other partner majors. The course emphasizes problem solving and collaboration in engineering. Students are given three projects focused on modern events. These projects can require extensive prior research to get up to speed. But can be extremely unique and engaging.

Uniting BME students with other partner majors gives students the opportunity to showcase all they have learned in their first 3 years focusing on their partner major. Coming together with others, they are given the chance to bring their different backgrounds together to make a final product.

Previous projects include testing the shake weight to see if it lived up to its marketing for faster muscle-building, revamping an electric wheelchair to connect to a smartphone, and monitoring patient reactions to a treadmill while simultaneously monitoring treadmill functions.
